

Case Study

Case Study Overview

This case study involves conducting a logistics network planning exercise for a large online retailer, focusing on optimising operations within a single warehouse located in Schönefeld. The objective is to leverage sales forecasts and historical data to efficiently plan warehouse capacity and improve order fulfilment accuracy.

Process Description

The planning process initiates with daily sales forecasts provided by the sales team. These forecasts detail the expected sales demand and are critical for planning the preparation/packaging of orders in the warehouse. This allows for precise capacity planning, ensuring the warehouse can accommodate incoming orders effectively.

Data Overview (provided via gsheet file)

- Sales Forecast: Daily sales demand projections for the Schönefeld Warehouse over the next four weeks (June 2024). It's important to note that the forecast dates are based on the order date timestamp, not when the warehouse actually receives the order.
- Historical Data: Information on the time lag between order placement (Date_order) and order receipt by the warehouse (Date_wh_receive), including item details.

Task

- Please devise a model and use it to forecast how many items will be received by the warehouse each day
- Please calculate the accuracy of your model with preferred accuracy/error metric
- Please use the provided Sales_Forecast for June to forecast items by date_wh_receive date (**Expected_output sheet**)
- **Please submit all your solution materials at least one days prior to the interview.**

Discussion Questions

- How would you interpret your accuracy results, what potential limitations does your model have, and how would you improve the forecast going forward?
- Output verification/Data checking: How would you verify your final forecast output as it is produced (e.g., automated checks, KPI monitoring, etc.)?

Overall Guidance

There are no definite right or wrong answers in this exercise. The goal is to familiarise yourself with the type of analytical work you'll be doing, while also evaluating your problem-solving skills and thought process.

Tools & Formats: You are welcome to use any coding language and supporting AI tool you prefer (e.g., Claude, Copilot, etc.) to assist your work. We encourage creativity in how you present your results; HTML (e.g. directly produced by LLM/AI), Markdown (.md), PowerPoint, or PDF files are all welcome.

Timing & Submission: Please submit your solution within **5 working days** of receiving these questions. All presentation materials (e.g. slides, excels, code, etc.) must be submitted at least **one day prior** to the scheduled interview. Please clearly show your work and thoughts, including all calculations and coding logic.
